FirePrograms Releases Multi-Department

New Option Integrates Data Management, Streamlines Oversight

Ocala, FL – FirePrograms, an industry leader in public safety records management software, has released a new solution that integrates multiple departments within a single application and database. This new multi-department software allows oversight from an administrative group, if applicable, while segmenting individual department data.

The multi-department software is available in both locally installed and web-deployed versions to meet the varying needs of public safety agencies. Existing FirePrograms customers, as well as new customers, can take advantage of this new multi-department software offering. It streamlines user account access across multiple agencies. Additionally, individual departments can still control access to their data and maintain separate data from other agencies in the group.

FirePrograms Software President, Gary Ewers, adds, “Understanding that many departments operate as part of county, or other organizationally structured multi-department agencies, we saw the need to develop a flexible solution to allow for data sharing and administrative oversight, while allowing individual agencies to maintain separate datasets as well.”

About FirePrograms Software
