

## Release 19.1.1.1001 D 5/29/19

### FirePrograms functionality changes and enhancements:

- Added a new Security format for Roles and Users (see below)
  - Enhanced control over new features
  - Please take a moment to review your Roles and adjust as necessary, given the new control capabilities.
- New Wizard Interface to quickly add new users
- Added new data logging interface
  - Home tab -> Activity Logs
- Added additional validation routine when exporting incidents to NFIRS

### Roles and Users:

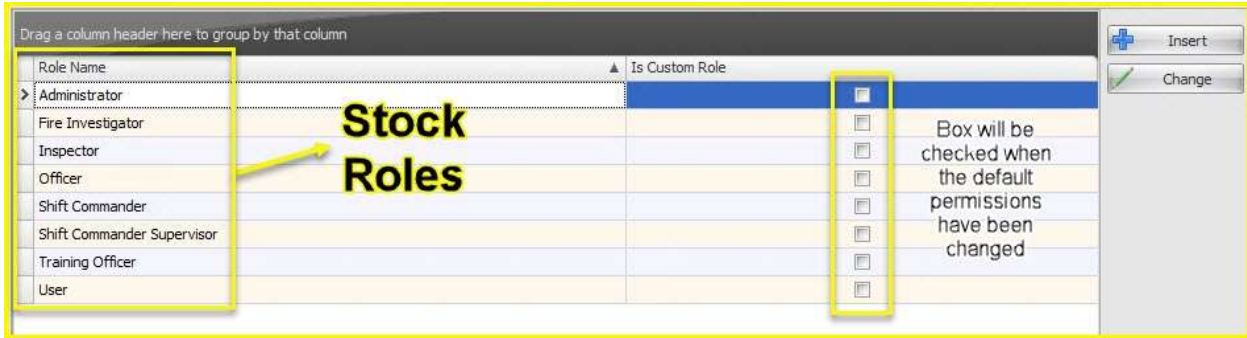

1. Go to the *Settings* tab and use the dropdown arrow in the **System Administration** button. Management of Roles and Users is now separated.

Roles - Templates of rights that can be assigned to users based on position, rank or responsibility.

Users - Login accounts for users where individual rights can be granted or passwords assigned.

2. The stock FirePrograms defined Roles are still available and initially set with default permissions. We highly recommend that you review each of the Roles to ensure that the desired permissions are enabled or disabled.

3. Once a Role is selected, such as Officer in the below screen shot, the **Customize Role** button MUST be clicked in order to make changes.

Users in Role - Displays user logins assigned the selected Role.

Feature Group Access - Determines if the selected Feature or Module will be Visible.

Feature Access - Feature Groups set to Visible will allow adjustment of permissions within that group and will vary per group.

**Hover the mouse over the Feature Group Name or Feature Name to display help text explaining what the selected permission controls.**
